                                                                                                                                                                                                                                                                                                        The present invention relates to a method of analysing microsatellite loci. The method involves co-amplifying a set of three microsatellite loci comprising at least one mononucleotide repeat locus and at least two tetra-nucleotide repeat loci from a sample of genomic DNA in a multiplex amplification reaction using primers and determining the size of the amplified DNA fragments obtained. The method is useful for analysing microsatellite loci and for detecting microsatellite instability (MSI) in genomic DNA microsatellite loci of the second genomic DNA, where the MSI results are useful in prognostic tumour diagnosis, in diagnosis of familial tumour predisposition, to detect cancerous tumours of the gastrointestinal system and of the endometrium, where the cancerous tumours are tumours from a colorectal cancer. The method is useful for detection of the second genomic DNA according to 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represents a poly d(T) PCR primer used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Analyzing micro-satellite loci for detecting or diagnosing cancer, by co amplifying set of three microsatellite loci from DNA sample in multiplex reaction using primers, and determining size of amplified fragments.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human MONO-15 loci amplifying primer #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAD36362 standard; DNA; 18

                                                                                                                                                                                                  The present invention describes a method for the comparative detection of the amount of an RNA. The method comprises: (a) cONAs obtained by transcribing respectively from at least two tissue RNAs are respectively fragmented by using a same restriction enzyme; (b) each different adaptor and a common adaptor are added to each of the cDNA fragments derived from the same or different tissues by the step (a); (c) the resultant adaptor added cDNAs are mixed together; (d) an adaptor primer having the common sequence to said different adaptor and a gene-specific adaptor are used to amplify said adaptor-added cDNAs containing no region derived from the magnify said adaptor-added cDNAs containing no region derived from color added to magnify and adaptor added to the measured by the step (b); (e) the ratios of the cDNA amounts are measured between the tissues; (f) the RNA is detected from the measured result; (g) each different adaptor and a common adaptor are added to each of the genomic DNA fragments derived from a same or commixed together; (i) the adaptor-added genomic DNAs are amplified by using an adaptor primer having the common sequence to the different adaptor and common sequence represents an oligonucleotide which is used in the common sequence represents an oligonucleotide which is used in the common sequence.
                                                                                                                       Query Match
                                                                                   Matches

                                                                                                                                                                                     lymphocytic leukaemia and acute myelogenous leukaemia; as probes for determining the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) of haematopoietic cell proliferation disorder related sequences and their complements; and as primers for the amplification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also be used for detecting a predisposition to, differentiation between subclasses, diagnosis, prognosis, treatment and/or monitoring of haematopoietic cell proliferative disorders. The present method enables highly specific classification of haematopoietic cell proliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a mechanical proliferative disorders differentiating between haematopoietic cell proliferative disorders associated with at least 1 gene and/or their regulatory regions in a subject. The method comprises contacting a target nucleic acid in a subject. The method comprises contacting a target nucleic acid in a subject. The method comprises contacting a target nucleic acid in a subject.

CC differentiating between haematopoietic cell proliferative disorders CC differentiating between haematopoietic cell proliferative disorders CC associated with at least 1 gene and/or their regulatory regions in a Subject. The method comprises contacting a target nucleic acid in a CC biological sample obtained from the subject with at least 1 reagent, CC which distinguishes between methylated and non-methylated CpG dinucleotides within the target nucleic acid. ABZ09961 to ABZ1118 CC represent specifically claimed nucleotide sequences from the present convention. Oligonucleotides from the present invention can be used: for CC invention. Oligonucleotides from the present invention can be used: for CC invention; the cytosine methylation state and/or single nucleotide collymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC lymphocytic leukaemia and acute myelogenous leukaemia; as probes for CC supclification of haematopoietic cell proliferation disorder related DNA sequences. The nucleotide sequences from the present invention can also CC used for detecting a predisposition to, differentiation between colleges of disorders allowing of haematopoietic cell proliferative disorders. The present method enables a highly specific classification of haematopoietic cell proliferative disorders. The present method enables a disorders and colleges of incorders and or method enables a disorders and colleges of incorders and colleges of inco

                                                                  The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified deoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification
The invention relates to an acyclic linker-containing oligonucleotide comprising at least one modified decoxyribonucleotide. Oligonucleotides of the invention are useful for preventing or decreasing translation, reverse transcription and/or replication of a target RNA in a system. They are useful for selectively preventing gene expression in a sequence-specific manner, for hybridising to complementary RNA such as cellular mRNA or viral RNA, to hybridise to and induce cleavage of complementary RNA. They are also useful therapeutically in formulations or medicaments to prevent or treat a disease characterised by the expression of a particular target RNA. The invention is used in gene therapy. The present sequence is an antisense oligo used to elicit human RNase (ribonuclease) H degradation of target RNA. This sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel acyclic linker-containing oligonucleotide useful for preventing decreasing translation, reverse transcription and/or replication of a target RNA in a system, comprises a modified deoxyribonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2'F-ANA antisense oligo #1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        07-AUG-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAD56446 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                        Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 2003-421516/39

                                                                                                                                                                                                            The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 18

                                                                                                                                                                                                                                                                                                                                                                                                                                     target RNA in a system, validating a gene target corresponding to a target RNA in a system or preventing or treating a disease related to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present sequence is an antisense oligonucleotide used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a new oligonucleoside which comprises at least one sugar modified nucleoside. The first segment comprises at least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 ceach of the first and second segments, so that it comprises at least 4 eleach of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a

The first segment comprises at least one sugar modified nucleoside. The second segment comprises at CC least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 2 of CC each of the first and second segments, so that it comprises at least 2 of alternating segments. The oligonucleoside is useful for preparing a CC composition for inducing RNase H-mediated cleavage of a target RNA in a System, preventing or decreasing translation, transcription or CC expetent, preventing or decreasing translation, transcription or CC expetent, in a system, validating a gene target corresponding to a CC target RNA in a system, validating a gene target corresponding to a CC target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) CC or hepatitis B. The invention is useful in gene therapy. The present corresponding to a charget RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) cor hepatitis B. The invention is useful in gene therapy. The present corresponding to a charget RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) cor hepatitis B. The invention is useful in gene therapy.

                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                    least one sugar modified nucleoside. The second segment comprises at least one 2 deoxynucleoside. The oligonucleoside comprises at least 2 deach of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, detecting the presence of a target RNA in a system, validating a gene target corresponding to a target RNA in a system, validating or transing a disease related to a target RNA in a system or preventing or transing a disease related to a target RNA in a system or preventing or transing a disease related to a target RNA in a system or preventing or transing a disease related to a target RNA in a system or preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system or preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of preventing or transing a disease related to a target RNA in a system of decreasing transition, and target RNA in a system of decreasing transition.

New oligonucleotide, useful for preventing or treating a disease related to a target RNA in a system, e.g., AIDS or hepatitis B.

Example 2; Page 35; 73pp; English.

The present invention relates to a new oligonucleoside which comprises at least one sugar modified nucleoside. The first segment comprises at least one sugar modified nucleoside. The second segment comprises at least one 2'deoxynucleoside in the oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 4 alternating segments. The oligonucleotide is useful for preparing a composition for inducing RNase H-mediated cleavage of a target RNA in a system, preventing or decreasing translation, transcription or replication of a target RNA in a system, validating a gene target corresponding to a target RNA in a system, validating a gene target corresponding to a target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) or hepatitis B. The invention is useful in gene therapy. The present

                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a new oligonucleoside which comprises at CC alternating first and second segments. The first segment comprises at CC least one sugar modified nucleoside. The second segment comprises at CC least one 2'-deoxynucleoside. The oligonucleoside comprises at least 2 of each of the first and second segments, so that it comprises at least 4 cC alternating segments. The oligonucleotide is useful for preparing a CC composition for inducing RNase H-mediated cleavage of a target RNA in a comprise segment, at the comprise of a composition or a target RNA in a system, replication of a target RNA in a system, detecting the presence of a carget RNA in a system, validating a gene target corresponding to a composition for inducing RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) C target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) C target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) C target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) C target RNA in a system, e.g., acquired immune deficiency syndrome (AIDS) C target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating a disease related to a CC target RNA in a system or preventing or treating the present composition for the invention is usef
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                   in any complete or partial genetic map of the human genome. GH-
polypeptides are useful as antagonists of GH-1 hormone action.
Polypucleotides encoding these polypeptides are useful in gene
The present sequence is a PCR primer used for amplifying human
                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to growth hormone 1 (GH-1) gene including single nucleotide polymorphisms (SNP). The GH-1 diagnostic polymucleotide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New growth hormone 1 (GH-1) diagnostic polynucleotide, useful as markers for the analysis of a disease, or of susceptibility to drug treatment for GH-1 dysfunction or other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2003-449555/42.

The method compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represent an immunostimulatory nucleic acid of the invention.

and/or preventing allergy or asthma using an immunostimulatory acid alone or in combination with an asthma/allergy medicament.

The invention relates to a method of inhibiting corneal allograft rejection, by contacting the allograft with a topical formulation comprising an antisense oligonucleotide targeted to intercellular adhesion molecule-1 (ICAM-1), extracellular adhesion molecule-1 (ELAM-1) or vascular cell adhesion molecule-1 (VCAM-1). The oligonucleotide is useful for inhibiting corneal allograft rejection or for preserving a corneal explant ex vivo, where the explant is human. This sequence

The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                ss; primer; immunosuppressive; antisense therapy; corneal allograft rejection; intercellular adhesion molecule-1; ICAM-1; extracellular adhesion molecule-1; ELAM-1; vascular cell adhesion molecule-1; VCAM-1; corneal explant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18
                                                                                                                                                                                                          The invention relates to a method of analysing microsatellite loci. Invention is used to detect microsatellite instability in prognostic tumour diagnosis, particularly a familial tumour predisposition, especially to detect cancerous tumours of the gastrointestinal system endometrium, most particularly colorectal cancer.                                                                     Matches
                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid (N1) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter; a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism na promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing NNA, detecting the presence of an optineurin promoter sequence variation in a sample containing NNA, determining the presence or increased
                                                                                                                                                                                                                             or progression of glaucoma in a patient, comprising providing amplification reaction primers that direct amplification of a selected nucleic acid region containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising obtaining a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and detecting the polymorphism). The invention is used to diagnose and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    glaucoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; optineurin; SNP; glaucoma; proc

                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated nucleic acid (NI) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter CC operably linked to a heterologous nucleic acid, a nucleic acid capable of CC detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a CC heterologous sequence, diagnosing or prognosing glaucoma in a sample CC obtained from a cell or bodily fluid (comprising detecting a polymorphism CC in a promoter region of the optineurin gene, associated with a glaucoma CC in a promoter region of the optineurin gene, associated with a glaucoma CC DNA, detecting a SNP sequence variation in a sample containing DNA, determining the presence or increased CC susceptibility to glaucoma or to a progressive ocular hypertensive CC disorder resulting in loss of visual field in a patient (or the severity correction of clausoma in a patient (or the severity correction).

The invention relates to an isolated nucleic acid (N1) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of CC detecting a single nucleotide polymorphism (SNP) in the optineurin CC promoter, a host cell comprising the promoter operably linked to a CC promoter region of the optineurin gene, associated with a glaucoma CC phenotype), detecting a SNP sequence variation in a sample containing the presence of an optineurin promoter sequence variation in a sample containing DNA, detecting a sample containing CC disorder resulting in loss of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing containing and amplifying the DNA) and detecting a polymorphism (comprising a containing a sample containing the variation within the optineurin companie of detecting a sample containing the variation within the optineurin companie of detecting a sample containing the variation within the optineurin companie of detecting a sample containing the variation within the optineurin companie of detecting a SNP located within an optineurin promoter, and companie of detecting a sample containing the variation within the optineurin compone and companies of detecting a sample containing the variation within the optineurin compone of the containing the variation of a selected containing a sample containing the variation within the optineurin compone of the containing the variation within an optineurin promoter, and compone of detecting the polymorphism. The invention is used to diagnose and component of the containing the variation within an optineurin promoter. The present sequence is an optineurin promoter motif, repeat element or containing the variation within an optineurin promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regula

                                                                                                                                                              This invention relates to a novel method for the concurrent interrogation of a number of polymorphic sites in the presence of, and without interference from, non-designated polymorphic sites. Specifically, it comprises conducting a multiplexed elongation assay by applying one or more temperature cycles to achieve linear amplification of the target or a combination of annealing and elongation steps under temperature-controlled conditions. Furthermore, this detection method uses probe extension or elongation and relies on enzymatic recognition, a superior technique that no longer depends on differential hybridisation. The present invention describes probes and methods useful for identifying or detecting polymorphisms at one or more designated sites, such that they can identify mutations within the cystic fibrosis conductance transmembrane regulator (CTR) or the human leukocyte antigen (HLA) genes. In addition, concurrent interrogation of a multiplicity of polymorphic sites is useful for genetic testing, carrier screening, genotyping or genetic profiling, and identity testing. This conductation is the negative control probe used for the elongation of the

acid. The genes and/or their regulatory regions are preferably selected from MDR1, CSNK2B, EGR4, AR, CDK4, RB2, CDC25A, GPIb beta, MYOD1, CDH3, CGSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TDF3, CDKN1E, CGSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TDF3, CDKN1C, CG GST91, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TDF3, CDKN1C, CG GSK3beta, ESR1, APAF1, BAK1, BAX or HOXA5. Oligomers, peptide nucleic acid (PNA)-oligomers and/or isolated nucleic acids based on the sequences of the genes are useful for detecting the methylation state of all the CG dinucleotides within one or more the sequences, or their complements, for determining the cytosine methylation state and or single nucleotide collicons such as diffuse large B-cell lymphoma, mantle cell lymphoma, conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, conditions buch as diffuse large B-cell lymphoma, mantle cell lymphoma, conditions of lymphoma subclasses, diagnosis, prognosis, treating and/or monitoring of lymphoid cell proliferative disorder. This sequence represents an oligonucleotide used to analyse of CpG positions within the
                                                                                                                                                                                                                                                                                                                                                                                               between lymphoid cell proliferative disorders associated with at least one gene and/or their regulatory resulpins in a subject by contacting a target nucleic acid in a biological sample obtained from the subject with at least one reagent or series of reagents that distinguish between methylated and non-methylated CDG dinucleotides within the target nucleic methylated and non-methylated CDG dinucleotides within the target nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               dinucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting and differentiating between lymphoid cell proliferative disorders comprises contacting a target nucleic acid with at least one reagent that distinguishes between methylated and non-methylated CpG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-MAY-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      methylated CpG dinucleotide; single nucleotide polymorphi diffuse large B-cell lymphoma; mantle cell lymphoma; chronic lymphocytic leukemia; small lymphocytic lymphoma;

Detecting and differentiating between lymphoid cell proliferative disorders comprises contacting a target nucleic acid with at least one reagent that distinguishes between methylated and non-methylated CpG

Claim 30; SEQ ID NO 354; 448pp; English

The invention relates to a method of detecting and differentiating CC between lymphoid cell proliferative disorders associated with at least CC one gene and/or their regulatory regions in a subject by contacting a CC target nucleic acid in a biological sample obtained from the subject with CC at least one reagent or series of reagents that distinguish between CC methylated and non-methylated CG dinucleotides within the target nucleic CC acid. The genes and/or their regulatory regions are preferably selected CC from MDR1, CSNK2B, BGR4, AR, CDK4, RB2, CDC25A, GPID beta, MYOD1, CDH3, CC GSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKN1C, CC GSTP1, HIC-1, MGMT, MLH1, MOS, MYC, PTEN, RBL2, TGFBR2, TP73, CDKN1C, CC GSK3beta, ESR1, APAF1, BAK1, BAX or HOXA5. Oligomers, peptide nucleic CC of the genes are useful for detecting the methylation state of all the CC Gridinucleotides within one or more the sequences, or their complements, CC conditions such as diffuse large B-cell lymphoma, mantle cell lymphoma, CC chronic lymphocytic leukemia, small lymphocytic lymphoma and follicular CC differentiation between subclasses, diagnosis, prognosis, treating and/or about the methylation state and or single nucleotide conditions and of lymphoid cell proliferative disorder. This sequence mentioned genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 2108
                                                  This invention relates to novel isolated polynucleotides with allelic cardiovascular associated (CA) polypeptides, which cardiovascular associated (CA) polypeptides, which cardiovascular disease. Specifically, it refers to methods for cardiovascular disease. Specifically, it refers to methods for that diagnose a predisposition or susceptibility for cardiovascular can be consisted as predisposition or susceptibility for cardiovascular can be consisted as probes for the detection describes specific CA genes that can be consisted as probes for the detection of genetic polymorphisms. Furthermore, consisted as probes for the detection of genetic polymorphisms. Furthermore, consisted as probes for the detection of genetic polymorphisms. Furthermore, consisted the used for treating cardiovascular disease such as elevated low can be used for treating cardiovascular disease such as elevated low consisty lipoprotein (LDI)-cholesterol levels, high blood pressure.

CA such, they can be described as having cardiant, cerebroprotective, antiatheroscierotic or hypotensive activities. This oligonuclostide sequence is a PCR primer used for amplifying human beta-migrating cardiovascular disparation of the plasminogen activator inhibitor 1 (SeqID 2) DNA, a CA gene of the
                                                                                                                                                                                                                                                                                                                                                                                              Novel isolated polynucleotide encoded by cardiovascular associated gene, useful for treating cardiovascular disease e.g., high blood pressure, myocardial infarction, stroke, atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       beta-migrating plasminogen activator inhibitor 1; PCR; primer; 88; cardiovascular associated; CA; atherosclerosis; ischaemia; hypertension; restenosis; cardiant; cerebroprotective; antiatherosclerotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ADF17789;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Homo sapiens

A protein of the invention has osteopathic activity. A polymucleotide of the invention may have a use in gene therapy. The composition and methods of the invention are useful in diagnosing, prognosing or treating osteoarthritis using polymorphisms in the matrilin-3 gene. The present sequence is used in the exemplification
                                                                                   Genetic marker selection; multiplex PCR amplification; prenatal diagnostic testing; foetal sex determination; genetic identification; DNA profiling; DNA fingerprinting; forensic analysis; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid molecule for diagnosing, prognosing or treating osteoarthritis comprises a matrilin-3 gene or its fragment or variant, and at least one polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human matrilin-3

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR primer used in the selection and amplification of genetic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Selecting genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal sex determination, comprises selecting each of the genetic markers according to a heterozygosity index.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1947/c

Specifically, it refers to the identification of the single nucleotide polymorphism G635A in human cytochrome gene CYP2C19, the T6235C SNP in human cytochrome gene CYP2C19, the T6235C SNP in human cytochrome gene CYP2C19, the T6235C SNP in human glutathione-S-transferase gene and the human aldehyde dehydrogenase gene ALDH2. Furthermore, gene polymorphisms in several target nucleic acids may be detected in a single sample by successive amplification of the individual targets. The present invention descries a fast, accurate and highly reproducible method of detecting a base substitution e.g. SNP, insertion of sensitivity to drugs and other substances, as well as other genomic investigations. This oligonucleotide sequence is a PCR primer used to amplify a human CYP1A1 gene, in an exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                19-JUL-2002; 2002JP-00211813.

                                                                                                                                                                                                 to form a transcription sample containing a cDNA template; eliminating single-stranded oligonucleotide from the transcription sample; and transcribing the cDNA template into RNA using an RNA polymerase. The method is useful for improving RNA polymerase based RNA transcription from a polynucleotide template. The method inhibits the undesired non-template derived production of RNA in the transcription reaction. Sequences ADI34483-ADI34489 represent oligonucleotides used in a T7 RNA
                                                                                                                                                                                                                                                                                                              sample. The method involves symmetries transcriptase and an incubating the sample RNA with reverse transcriptase and an oligonucleotide primer that primes synthesis in a direction toward 5' of the RNA; converting the single-stranded cDNA into double-stranded of the RNA; converting the single-stranded cDNA template; eliminating
                                                                                                                                                                                                                                                                                                                                                                                   eliminating single-stranded oligonucleotide from the transample. The method involves synthesizing single-stranded

The invention relates to a novel diagnostic polynucleotide composition.

The polynucleotide composition comprises: a sequence encoding a polynucleotide with defined sequences given in the specification; a sequence capable of hybridizing to a melanin-concentrating hormone receptor 1 (MCHR1) gene; a polynucleotide encoding an MCHR1 polypeptide; or a sequence comprising one or more of the nucleotide exchanges (SNP's) given in the specification and at least 8 bases of surrounding sequence of the MCHR1 gene. The composition has anorectic activity. The polynucleotide composition may be used in gene therapy to treat the disorders of the invention. The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for presenting a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide represents an MCHR1 primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

The composition is useful for diagnosing obesity related to the presence of a molecular variant of the MCHR1 gene or a susceptibility to the disorder. The MCHR1 protein or polynucleotide is useful for preparing a medicament for treating or preventing obesity related to the presence of a molecular variant of the MCHR1 gene. This polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18 BP; 4 A; 2 C; 7 G; 5 T; 0 U; 0 Other;

                                   The invention relates to a method of determining a functional property of a fluid in a chamber comprising introducing into the chamber a support to CC which is bound several test elements, each of the test elements CC comprising a reaction domain and a detection domain, introducing into the Cc chamber a fluid that is interactive with the reaction domains, removing CC the locations at which the fluid has not interacted with the reaction CC domains, and relating the locations to the functional property of the CC comprises a member of a specific binding pair. The detection domain cCC comprises a member of a specific binding pair. The detection all property is CC chosen from the flow pattern of the fluid. The functional property is CC chosen from the flow pattern of the fluid, reagent distribution within CC useful and time dependent reactivity of the fluid. The method is useful for determining a functional property of a fluid in a chamber and CC for synthesising arrays of biopolymers e.g., arrays of polynucleotides. CC method provides for the characterisation of a new fluid/flow cell combination. This sequence represents a test element used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  S
                                                                                     The present invention relates to detecting the methylation state of the CC contacting a target nucleic acid having one or more sequences selected CC from 5 3581 base pair sequences in a biological sample with at least one reagent or a series of reagents. The method is useful for detecting the CC methylation state of the 5 and promoter region of the gene DB within a CC subject. The set of oligonucleotides comprising at least three of the CC oligoners is useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) within SEQ. ID NO. 1-5 and its complementary sequences. The set of oligoners is also useful for detecting the methylation state of all CpG dinucleotides within SEQ ID CC oligonucleotides can be used as primer oligonucleotides within SEQ ID CC amplification of DNA sequences. The set of all CpG dinucleotides for the CC complementary sequences selected from SEQ ID NO. 1-5 and its complementary sequences selected from SEQ ID NO. 1-5 and its complished to sequences selected from SEQ ID NO. 1-5 and its comprising at least one nucleic acid. The methylation state of the gene DD3 comprising diseases associated with the methylation state of the gene DD3 coligonucleotide or PNA-oligomer, kit, array or the set of oligonucleotides is useful for the characterization, classification, classification, grading, staging, and/or diagnosis of cell proliferative disorders. The present sequence represents a detection oligonucleotide of the invention.

The invention relates to an antisense oligonucleotide targeting human CC intercellular adhesion molecule (ICAM-1) having a sequence appearing as CC ADM46473. In the oligonucleotide, at least one adenosine nucleotide is complaced with a thymidine, cytidine or guanosine nucleotide, at least one thymidine or cytidine or guanosine nucleotide, at least one cadenosine, thymidine or cytidine or guanosine nucleotide is replaced with an adenosine, cytidine or guanosine concleotide, the providence of the sequence of the sequence of the cytidine or guanosine concleotide is replaced with an adenosine, cytidine or guanosine concleotide. The oligonucleotide is one of 88 disclosed antisense concleotide. The oligonucleotide is one of 88 disclosed antisense concleotide is replaced with an adenosine, cytidine or guanosine concleotide. The oligonucleotide is one of 88 disclosed antisense concleotide is compound the sequence of adhesion molecule (VCAM-1) compound 8-80 nucleobases in length targeted to human ICAM-1 mRNA compound specifically hybridises with the human ICAM-1 mRNA confidence is useful for modulating the activity of the RNA and DNA confidence is useful for modulating the activity of the RNA and DNA confidence of the synthesis and metabolism of specific cell adhesion molecules. It is also useful for the diagnosis, as research confidence is suitable for treating inflammatory ophthalmological disorders including redness and inflammatory ophthalmological disorders including redness and inflammatory ophthalmological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-AUG-1990;
02-SEP-1992;

The invention relates to a novel isolated human protein for promoting the transformation of 3T3 cells and contains any of the 31 amino acid sequences defined in the specification. The invention further provides: an isolated polynucleotide that encodes any of the proteins described above; a vector containing any of the said polynucleotides; a host cell for genetic engineering, which is transformed or transduced by the polynucleotide or vector described above; a process for producing the product; and an antibody binding specifically with the CC numan protein. The 3T3 transformation promoting human protein has cytostatic activity. The protein and its encoded polynucleotide are useful for promoting the transformation of 3T3 cells, together with CC expression vectors and transformants for the transent of disorders, such as cancer. This polynucleotide sequence represents a primer for the CC DNA encoding one of the 3T3 transformation promoting human proteins of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           allergic reactions. The oligonucleotides can also be used to preserve corneal explants ex vivo and to prevent corneal allograft rejections. specific hybridisation exhibited by the oligonucleotides may be used assays, purifications or cellular product preparations. The present sequence is an antisense oligonucleotide targeting ICAM-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human protein for promoting transformation of 3T3 cells and its encoded polynucleotide, applicable in producing recombinant proteins and in gent therapy of e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              07-AUG-2002; 2002CN-00136401.

                                                                              of a late-onset neurodegenerative disease to a patient which comprises analysing a sample from the patient to determine whether the patient has a D-amino acid oxidase (DAO) abnormality, where the presence of a DAO abnormality is an indication that the patient has an increased risk of the late-onset neurodegenerative disease. DAO is a flavin dinucleotide (FAD)-dependent oxidase which catalyses the oxidative deamination of D-amino acids (EC.1.4.3.3). The method of the invention has neuroprotective and antiparkinsonian applications and may be useful in determining an increased risk of a late-onset neurodegenerative disease to a patient, as well as in preparing a medicament for treating a late-onset neurodegenerative disease (DA), or Albertmer's disease (DA) or Albertmer's disease (DA) or Albertmer's disease (DA)
                                                                                                                                                                                                                                                                                                                                                          Determining an increased risk of a late-onset neurodegenerative disease to a patient comprises analyzing a sample from the patient to determine whether the patient has a D-amino acid oxidase (DAO) abnormality.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           flavin dinucleotide; FAD-dependent oxidase;

Sequence 18
                               Parkinson's disease (PD) or Alzheimer's disease (AD), possibly via therapy. The current sequence is that of a PCR primer of the invent which was used during linkage analysis of human D-amino acid oxidate.
                                                                                                                                                                                                                                                                                                                            Example 1; SEQ ID NO 73; 209pp; English.

CC synthesis primer to RNA, separating the cDNA with an adaptor through 5'-phosphate on strand (II) of the adaptor through 5'-phosphate on strand (II) of the adaptor to single comediated using DNA ligase, and amplifying the obtained ligated single stranded fragment in an molecular amplification procedure. The method is coseful for: synthesising a single stranded cDNA by a 5'-ligated adaptor-comediated process, where the source of nucleic acid is chosen from blood, comediated process, where the source of nucleic acid is chosen from blood, complify the cDNAs corresponding to the mRNAs collection of mRNA molecules in a sample, where the method is collection of mRNA molecules in a sample, where the method is applied to complify the cDNAs corresponding to the mRNAs by annealing one or more containing single stranded cDNA (sense) by use of streptavidin coated manks collection from a first mRNA population by the method, containing single stranded cDNA (sense) by use of streptavidin coated magnetic beads, synthesising a double-stranded cDNA collection from a second mRNA population according to the method, isolating the biotin-containing single stranded cDNA (anti-sense) by use of streptavidin coated magnetic beads, hybridised sub-population of the anti-sense cDNA is found. CC isolating the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated cDNA, and generating a second double-stranded cDNA collection from the unhybridised sub-population by CR using primer 1 and population. The method is an improved method for producing amplified containing single stranded cDNA collection single stranded cDNA.

CC production single stranded cDNA is a per-selected cell collection acid. This sequence represents a poly-A-tail used to in the collection single stranded cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 2120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primer to RNA and synthesize single stranded cDNA using stranded cDNA fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Synthesizing single stranded cDNA, involves annealing cDNA synthesis primer to RNA and synthesizing first cDNA strand, ligating adaptor to single stranded cDNA using DNA ligase, and amplifying ligated single

Synthesizing single stranded cDNA, involves annealing cDNA synthesis primer to RNA and synthesizing first cDNA strand, ligating adaptor to single stranded cDNA using DNA ligase, and amplifying ligated single stranded cDNA fragment.

CDNA γd

Example 1; SEQ ID NO 7; 22pp; English

The invention describes a method of synthesising single stranded cDNA by CC a 5'-ligated adaptor-mediated process involving: annealing a cDNA CC synthesis primer to RNA, separating the cDNA strand from the RNA, CC purifying the cDNA, contacting the cDNA with an adaptor, ligating the CC stranded wing DNA ligase, and amplifying the obtained ligated single CC stranded fragment in an molecular amplifying the obtained ligated single CC serum, plasma, cerebrospinal fluid, urine, tissue samples, biopsies and CC saliva. The tissue sample comprises a cell population which may be single collection of mRNA molecules in a sample, where the method is applied to collection of mRNA molecules in a sample, where the method is subtractive hybridisation probe which involves synthesising a constaining single stranded cDNA synthesis primers to several mRNAs in the sample, producing a complify the cDNAs corresponding to the mRNAs by annealing one or more containing single stranded cDNA (collection from a first mRNA population by the method, where primer 1 is modified by biotin in the 5' end, isolating the biotin-coated magnetic beads, synthesising a double-stranded cDNA collection from a second mRNA population according to the method, isolating the mon-biotin-coated magnetic beads, hybridising to the method, isolating the mon-biotin-coated magnetic beads, hybridising to the method, isolating the mon-biotin-coated magnetic beads, hybridising to the method, isolating the mon-biotin-coated magnetic beads, hybridising the sense to the anti-sense cDNA, where cDNA, and generating a second double-stranded cDNA collection from a second mRNA population of the anti-sense cDNA by use of streptavidin coated cDNA, and generating a second double-stranded cDNA collection from the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated cDNA, and generating a second double-stranded cDNA collection from the unhybridised sub-population of the anti-sense cDNA by use of streptavidin coated cDNA collection from the unhybridised s

                                                                                      amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I), and determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and predisgnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           primer 2; and detecting expression of a gene in a pre-selected cell population. The method is an improved method for producing amplified heterogeneous populations of cDNA from limited quantities of RNA or nucleic acid. This sequence represents the complement of a poly-A-ta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gene typing; polymorphic microsatellite loci; PML; disease predisposition; microsatellite market; prion disease; cystic fibrosis; malignant hyperthermia syndrome, metabolic disease; milk protein; hormone; transcription factor; pT7-blue-vector; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADO81024 standard; DNA; 18 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCI
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 3;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2004-215730/21.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (UYHO-) UNIV HOHENHEIM.

CC phenotypic preferences in test organisms or parts, where the test constraint and comparism of interest and organisms that are related to the organisms of interest; CC and (b) replacing the first codon with the synonymous codon to construct the synthetic polymucleotide. Also described: (1) a method for CC determining the phenotypic preference of a first codon in an organism of interest or its parts; (2) a synthetic polymucleotide constructed from the method above; (3) an organism or interest or part containing a synthetic constructed from CC synthetic polymucleotide constructed from the method above; (4) an CC organism or interest or part containing a synthetic construct that CC of a first codon fused in frame with a reporter polymucleotide that CC of a first codon fused in frame with a reporter polymucleotide that CC encodes a reporter protein, which produces, or is predicted to produce a constructed phenotype or a phenotype of the same class as the selected phenotype that is displayed by an organism of interest or part condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part the condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part the condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part the condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part the condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part the condess the polypeptide; (6) a method of enhancing the quality of a selected phenotype that is displayed by an organism of interest or part the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of the parent phenotypic preference than the first codon in a comparison of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18 BP; 3 A; 2 C; 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          12-AUG-2004

The method is useful for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. It is useful for modulating the quality of a selected phenotype displayed by an organism or part. The present sequence encodes a synthetic leader sequence, which is used in an example from the present
The present invention describes a method for constructing a synthetic polynucleotide from which a polypeptide is producible to confer a selected phenotype to an organism of interest or part in a different quality than that conferred by a parent polynucleotide that encodes the same polypeptide. The method comprises: (a) selecting a first codon of the parent polynucleotide for replacement with a synonymous codon, where the synonymous codon is selected on the basis that it exhibits a different phenotypic preference than the first codon in a comparison of phenotypic preferences in test organisms or parts, where the test organism are selected from organisms of the same species as the organism of interest and organisms that are related to the organisms of interest; and (b) replacing the first codon with the synonymous codon to construct the synthetic polynucleotide. Also described: (1) a method for determining the phenotypic preference of a first codon in an organism of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18 BP; 0 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Constructing synthetic polynucleotide for modulating the quality of a selected phenotype displayed by an organism comprises replacing a first codon with a synonymous codon to construct the synthetic polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic leader sequence encoding DNA SEQ ID NO:75

                                                                                                                      CC the method above; (3) an organism or interest or part containing a cc synthetic polynucleotide constructed from the method above; (4) an CC synthetic polynucleotide constructed from the method above; (4) an CC organism or interest or part containing a synthetic construct that CC comprises a regulatory polynucleotide operably linked to a tandem repeat CC encodes a reporter protein, which produces, or is predicted to produce a CC selected phenotype or a phenotype of the same class as the selected CC phenotype in the organism or part; (5) a method of modulating the quality of a selected phenotype that is displayed by an organism of interest or CC part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; (6) a method of enhancing the quality of a cleeted phenotype that is displayed by an organism of interest or part and that results from the expression of a parent polynucleotide that CC encodes the polypeptide; and (7) a method of reducing the quality of a cleeted phenotype that is displayed by an organism of interest or part CC and that results from the expression of a parent polynucleotide that CC encodes the polypeptide. The method of aparent polynucleotide that CC encodes the polypeptide. The method is useful for constructing a CC synthetic polynucleotide that encodes the polypeptide. The method is useful for constructing a cc selected phenotype to an organism of interest or part in a different CC asset polynucleotide to an organism of interest or part in a different CC entered by an organism of interest or part in a different CC entered by an organism of interest or part in a different CC entered by an organism or part. The present sequence encodes content of the conten

The method of the invention has cytostatic applications and may be useful for identifying a subject at risk of breast cancer, for early diagnosis, prevention and treatment of breast cancer, possibly via gene therapy, as well as to analyse and predict a response to a breast cancer treatment and in clinical drug trials. The current sequence is that of an Extend primer (also described as probe) of the invention which was used to genotype human intercellular adhesion molecule ICAM-1/ICAM-4/ICAM-5 gDNA. ICAM-1 (human rhinovirus receptor;BB2 ;CD54;cell surface glycoprotein P3.58) has been mapped to chromosomal position 19p13.3-p13.2, ICAM-4 (Landsteiner-Wiener blood group;LW) has been mapped to chromosomal position 19p13.2-cen and ICAM-5 (telencephalin) has been mapped to chromosomal position 19p13.2-cen and ICAM-5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for identifying a subject at risk of breast cancer comprising detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 4; Page 83; 289pp; English

The invention relates to a class of CpG immunostimulatory oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allergy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, viral and bacterial infections and cancer e.g. biliary tract cancer, present cancer, carvical cancer, choriocarcinoma, colon cancer, endometrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, brain and CNS cancer, sarcomas, thyroid cancer, oesophageal cancer, becancer, Hodgkin's lymphoma, larynx cancer, oral cavity cancer, skin cancer, testicular cancer, as well as other carcinomas and sarcomas. (vănilloid receptor type 1) receptor, or a functional derivative, allo or fragment of this region, or a sequence that hybridises to it under standard conditions. The VR1 modulator is derived from one or more of positions 221931-223344 of GenBank AL670399, 31673-36359 of AL663116,

AL663116, or

describes a novel nucleic acid containing a specific at least one region that modulates expression of the

of the

紐

This invention

segment having

Disclosure; Page 52; 68pp; German.

New nucleic acid that modulates expression of the vanilloid receptor-1, useful for control of pain or sensitivity disorders, comprises sequence from control regions of the receptor gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pain, particularly in primary sensory neurons. The invention also describes a vector that contains the VR1 modulator, host cells containing this vector (other than human germ or embryonal stem cells) and a method for modulating expression of the VR1 receptor by introducing the modulator or the vector into a cell that contains the VR1 gene. The products of the invention are used for detecting a transcription factor from its binding to a regulatory sequence (or a double-stranded oligonucleotide fragment of it), e.g. by Western blotting or enzymelinked immunosorbant assay, particularly for diagnosis of diseases associated with overexpression or underexpression of the transcription factor. The region that modulates VR1 receptor expression includes a binding site for a transcription factor, e.g. MZF1, NFkappaB, NFAT or GATAI. The nucleic acids of the invention, or vectors containing them,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            are used for prevention or treatment of pain, also for treating sensitivity disorders, e.g. analgesia, hypalgesia or hyperalgesia, also neuralgia and myalgia, that are associated with activity of the VR1 receptor. This sequence represents a fragment of human VR1 exon 1d DNA which is capable of binding to a transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18
Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                           27-DEC-2000; 2000JP-00399443.

CC evaluating and screening drugs using genetic polymorphism data. Genetic CC polymorphism data, particularly that relating to single nucleotide CC polymorphisms (SNPs), may be used in studying the relationship between CC DNA sequence variations and human diseases, conditions, and responses to CC drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful in the above respects as they are stable in populations, occur frequently, and have lower mutation rates than other genome variations of in genes encoding drug merabolising enzymes allows the customisation of CC drug therapies based upon the genetic profile of individual patients. CC This would not only take the guesswork out of selecting the drug with the CC greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. CC enholes of the invention are also useful in the drug discovery and CC approval processes. For example, individuals could be selected for capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more capable of responding to a particular drug or drug class, and previously failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy or medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polymorphisms may be identified in a nucleic acid sample using probes on primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic aci
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        one polymorphism in such drug metabolising enzyme-encoding genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequences ABZ43217-ABZ50887

                                                                                                                                                                                                                                                                                                                                                                              in the above respects as they are stable in populations, occur of frequently, and have lower mutation rates than other genome variations such as repeating sequences. The detection and analysis of polymorphisms in genes encoding drug metabolising enzymes allows the customisation of drug therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. Wethods of the invention are also useful in the drug discovery and approval processes. For example, individuals could be selected for clinical trials only if their genetic profiles indicate that they are capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more appropriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of possible drug targets and decreases in the number of adverse drug reactions, failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between polymorphisms (SNPs), and buman diseases, conditions, and responses to DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful that cause or exacerbate certain diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphism may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of

CC in the above respects as they are stable in populations, occurred frequently, and have lower mutation rates than other genome variations of such as repeating sequences. The detection and analysis of polymorphisms of in genes encoding drug metabolising enzymes allows the customisation of control of the customisation of the greatest therapies based upon the genetic profile of individual patients. This would not only take the guesswork out of selecting the drug with the greatest therapeutic effect for a particular patient, but would also reduce the likelihood of adverse reactions, thereby increasing safety. CC Methods of the invention are also useful in the drug discovery and capable of the invention are also useful in the drug discovery and comportant patient populations. The methods data and previously failed drug candidates could be revived if they were matched with more capable of responding to a particular drug or drug class, and previously failed drug candidates could be revived if they were matched with more caparopriate patient populations. The methods, data and compositions of the invention may therefore lead to a an increase in the range of compositions failed drug trials, the time taken for a drug to be approved, the length of time patients are on medication and the number of different medications a patient needs to take before finding an effective therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; drug metabolising enzyme; gene; drug metabolism; chromosome 19; polymorphic site; drug evaluation; drug screening; genotyping; genetic profiling; therapeutic customisation; adverse reaction; clinical trial; drug approval; single nucleotide polymorphism; SNP; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      evaluating and screening drugs using genetic polymorphism data. Genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes that cause or exacerbate certain diseases. SNPs are particularly useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays, nucleic acid arrays and PCR-based methods. The invention also encompasses methods of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 23; Page 102; 2785pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              effectiveness or side effect detecting at least one polymo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nakamura Y, Sekine A,

Sequences ABZ43217-ABZ50887 represent polymorphic sites within genes encoding enzymes associated with drug metabolism. The invention relates to methods and compositions for identifying individuals who have at least one polymorphism in such drug metabolising enzyme-encoding genes. The polymorphisms may be identified in a nucleic acid sample using probes or primers specific for a sequence selected from ABZ43217-ABZ50887 using a variety of detection assays, including hybridisation assays mucleic acid arrays and PCR-based methods. The invention also encompasses methods of evaluating and screening drugs using genetic polymorphism data, particularly that relating to single nucleotide polymorphisms (SNPs), may be used in studying the relationship between DNA sequence variations and human diseases, conditions, and responses to drugs. SNPs are also useful as polymorphism markers for discovering genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 41
                                                                                                                                                                                                                                                        Identifying individuals having a polymorphism, useful for determining the effectiveness or side effect of a drug or treatment protocol, comprises detecting at least one polymorphism in the drug metabolizing enzyme
